SYSTEM AND METHOD FOR
CREATING A CLINICAL RESUME

ABSTRACT OF THE INVENTION

5   A system and method are provided for automatically

generating a summary document with information mined from a data

repository. The database stores information garnered from a plurality

of sources. The information includes the type of data which can be

easily organized into fields, as well as less definable data such as

10   transcribed dictation. The information is converted into a markup

language for parsing and storage as tagged data and marked up data

objects. The summary document is created from the tagged and

marked up data objects. Specific examples are also provided for the

generation of a clinical resume type summary document.
